

Abstract of the Disclosure

A dieting device inhibits oral ingestion of food. At least one pair of frames is secured to the maxillary and mandibular dentitions respectively of a wearer. Opposing frames are magnetically pulled toward one another or repelled from one another to inhibit, but not prevent, ~~injection~~ ingestion or mastication, respectively. The frames cover the upper left and right and lower left and right dental quadrants ~~respectively~~. The frames fit snugly over the teeth included in the quadrants. The frames include a cover ~~which~~ that overlies the teeth biting surfaces and a side wall on one side which overlies the exposed areas of the teeth above the gums. On the alternate side of the frames are mounted inter-dentally extensible and retractable screws for clamping the frames to the teeth.
